

Spatiotemporal data analysis of precipitation in Brest's territory

Application to urban hydrology

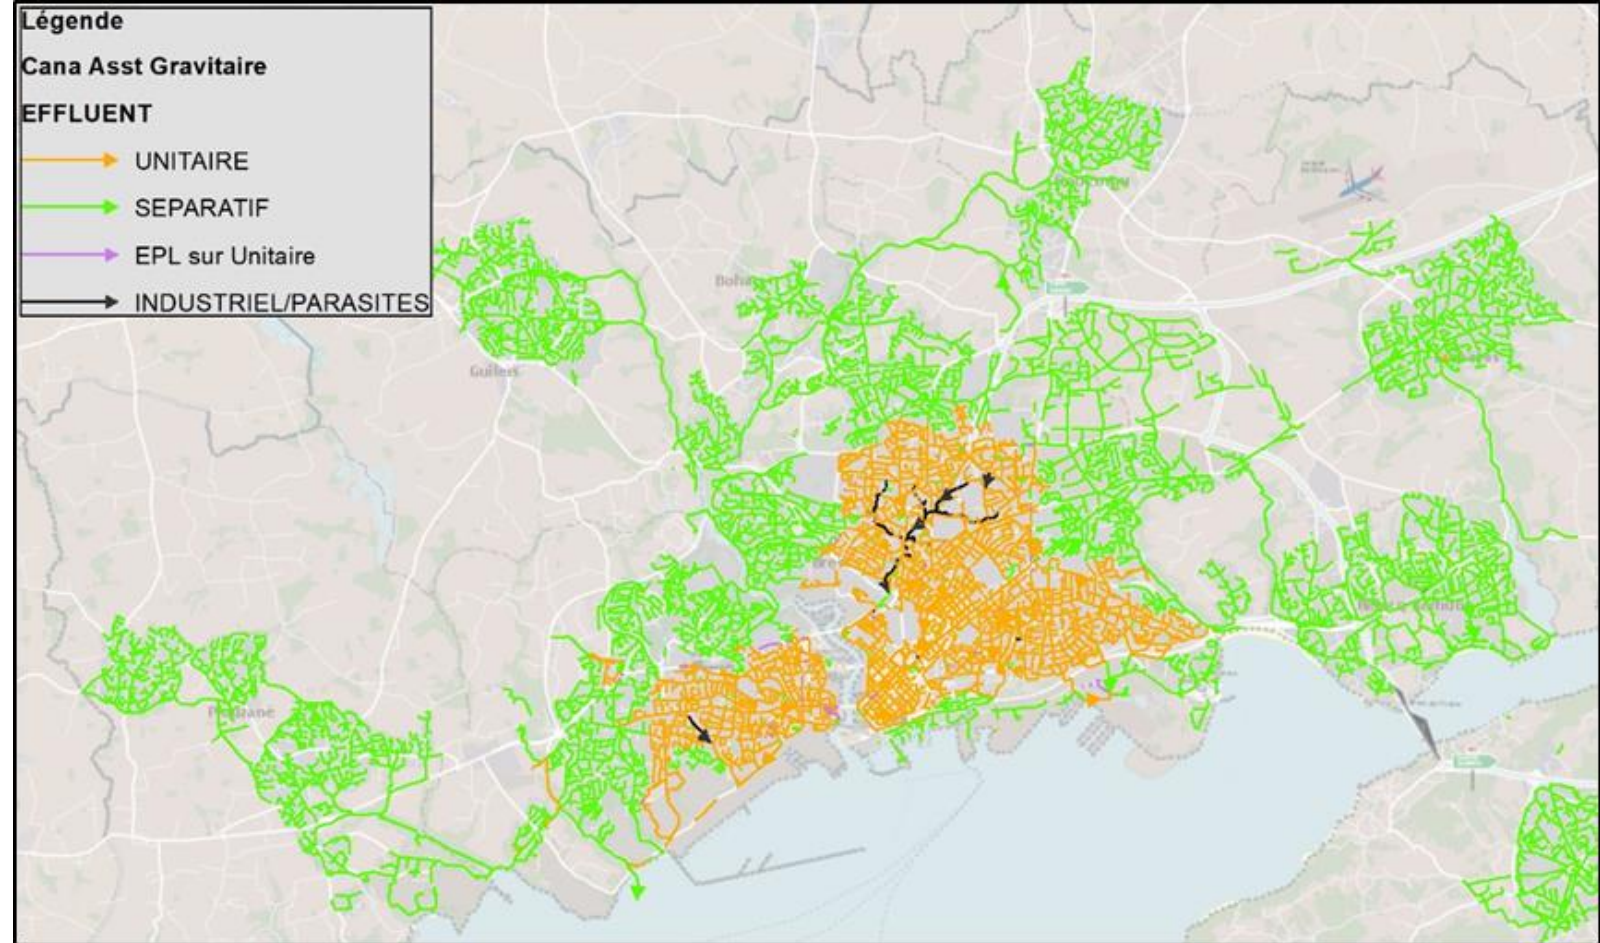

INTRODUCTION

Sewerage systems designing methodology

Separated = waste water

Combined = waste + storm water

Strong precipitations
→ **dumping**

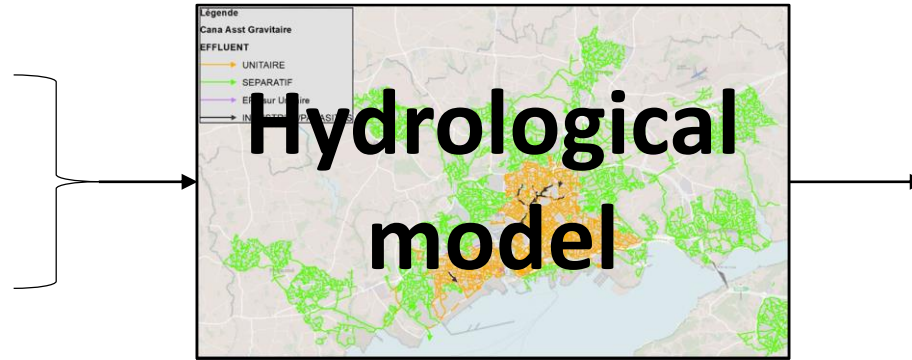

Goal:

Designing systems to manage waste water dumping into the environment

FORCINGS

- Precipitation
- Waste water
- Evapotranspiration

OUTPUT

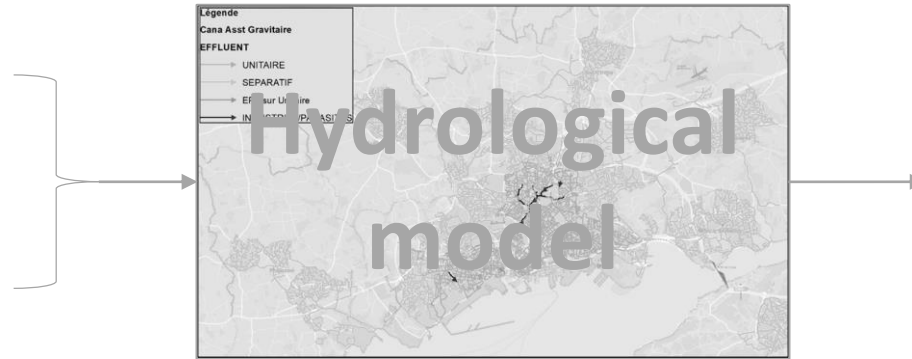

Dumping

Goal:

Designing systems to manage waste water dumping into the environment

FORCINGS

- Precipitation
- Waste water
- Evapotranspiration

OUTPUT

Dumping

Data sources

1) Eau du Ponant : 10 gauges

2) Météo France : 1 gauge, radar images

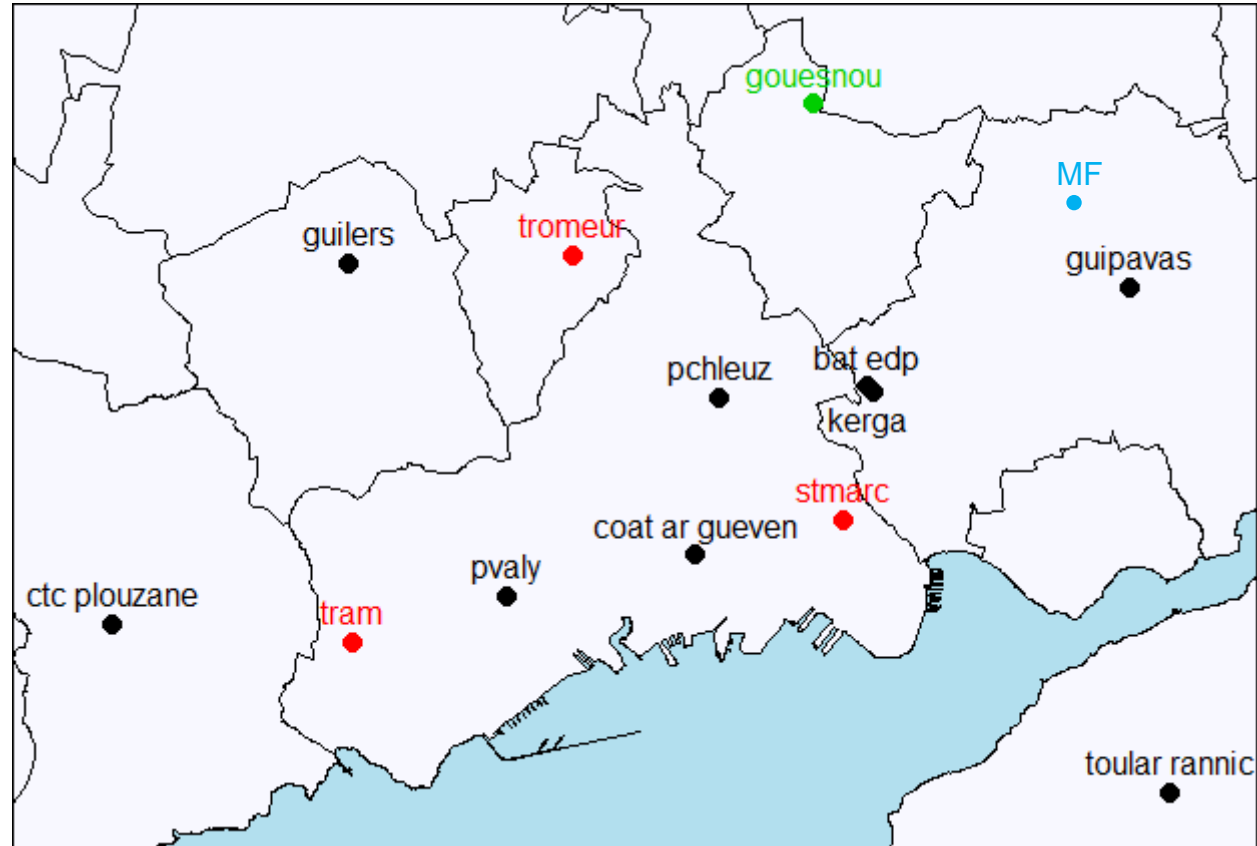

DATA

EAU DU PONANT

11 gauges

0.2 mm

3 minutes

EAU DU PONANT

<2014 : manual correction

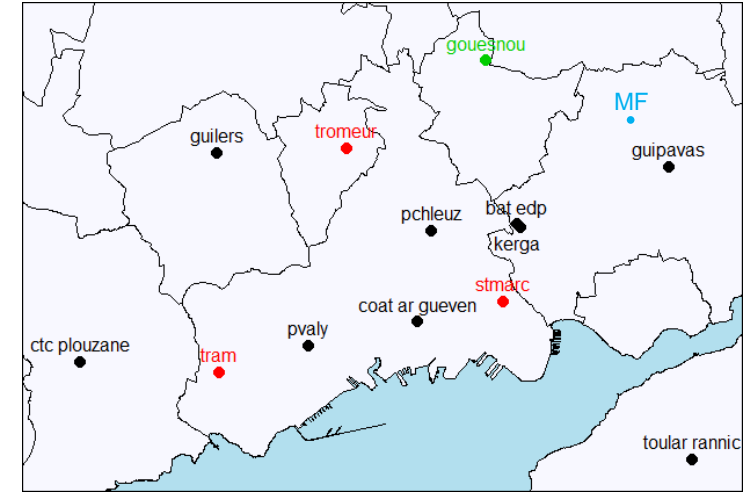

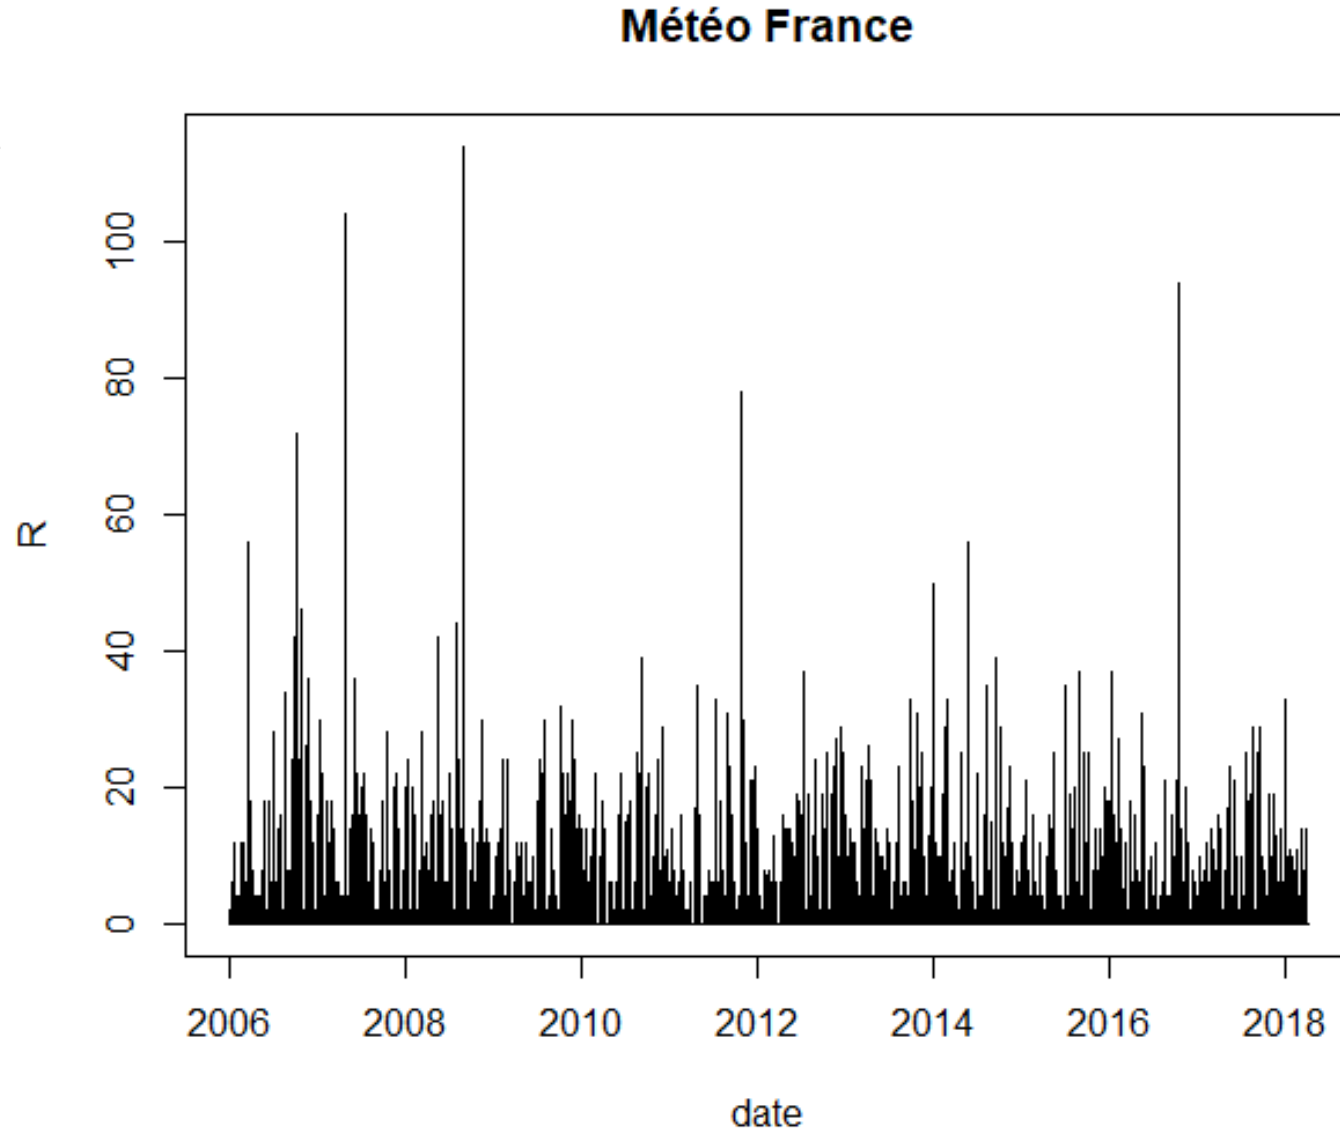

>2014 : raw data

Can we trust the data?

1 gauge
0.2 mm

SPATIAL STRUCTURE

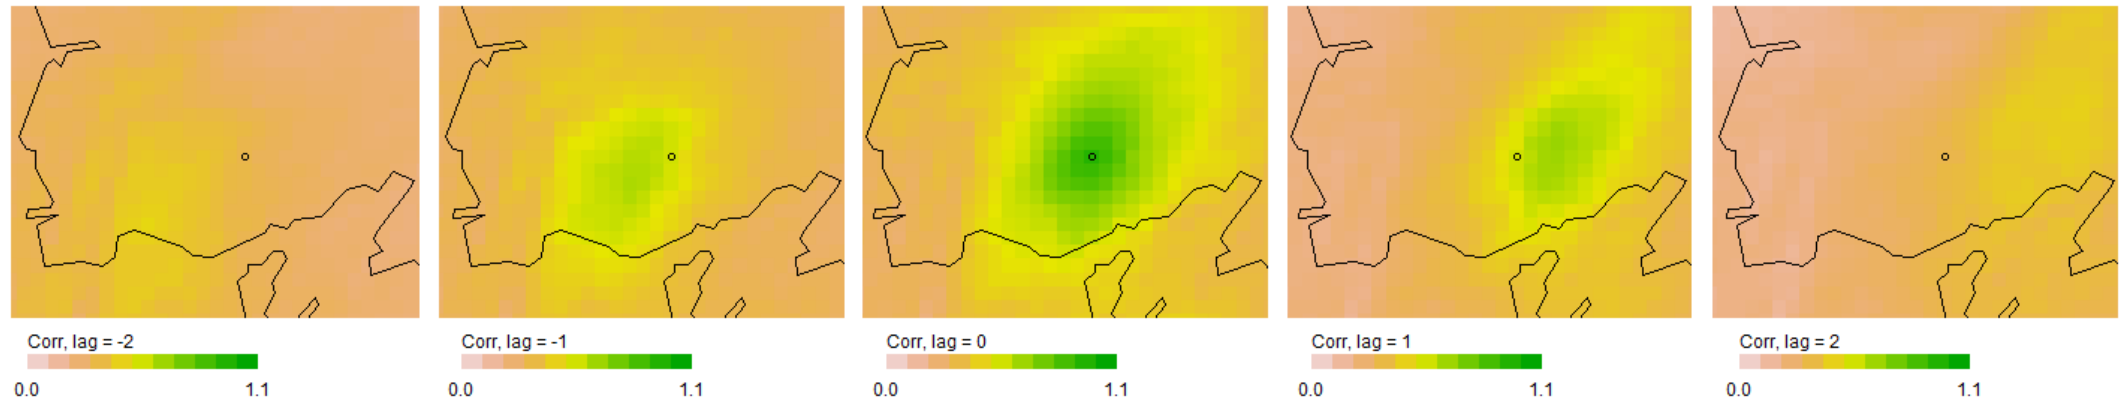

MOVEMENT

- Gauges

Lag de corrélaiton max entre les stations EDP et la station MF

- Radar

CONCLUSION

CONCLUSION

Gauges network has many outliers

BUT they represent a reliable information in terms of values and spatial variability

Radar images are heterogeneous and heavily processed

BUT they have a very good representation of rain cells movement

Merging

1) movement from radar images to make a prediction

2) the values from gauges are kept according to whether or not they match the prediction

Thank you
